About the lab setup:

RDS Postgres Database is used as a source of ticket sales system for sporting events. It stores transaction information about ticket sales price to selected people and ticket ownership transfer with additional tables for event details. AWS Database Migration Service (DMS) is used for a full data load from the Amazon RDS source to Amazon S3 bucket.

Before the Glue lab starts, you might choose to skip the DMS data migration, instead copy the source data to your S3 bucket directly.

In today's lab, you will copy the data from a centralized S₃ bucket to your AWS account, crawl the dataset with AWS Glue crawler for metadata creation and transform the data with AWS Glue to Query data and create a View with Athena and Build a dashboard with Amazon QuickSight.

Make sure you are in the us-east-1 (Virginia) region

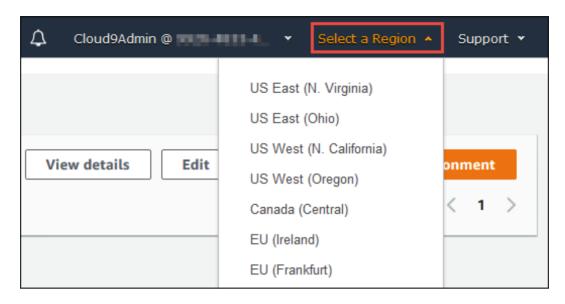

Setup Cloudy IDE for Data Copy

In AWS Cloud9, a development environment (or just environment) is a place where you store your development project's files and where you run the tools to develop your applications. In this tutorial, you create a special kind of environment called an EC2 environment and then work with the files and tools in that environment.

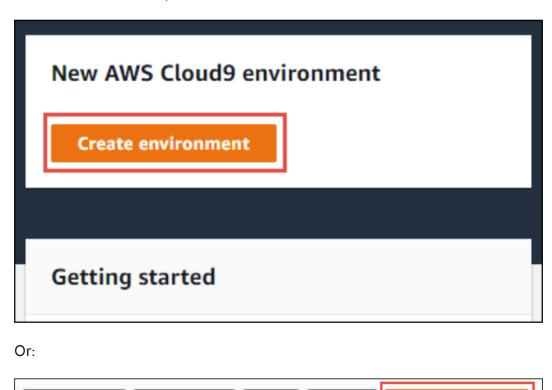

Create an EC2 Environment with the Console

- 1. Sign in to the AWS Cloud9 console as follows:
 - If you're the only individual using your AWS account or you are an IAM user in a single AWS account, go to https://console.aws.amazon.com/cloudg/.

2. After you sign in to the AWS Cloud9 console, in the top navigation bar, choose **US East (N.** Virginia) AWS Region to create the environment in. For a list of available AWS Regions, see AWS Cloude in the AWS General Reference.

If a welcome page is displayed, for New AWS Cloud9 environment, choose Create environment. Otherwise, choose Create environment.

Edit

View details

Delete

Create environment

Open IDE [2]

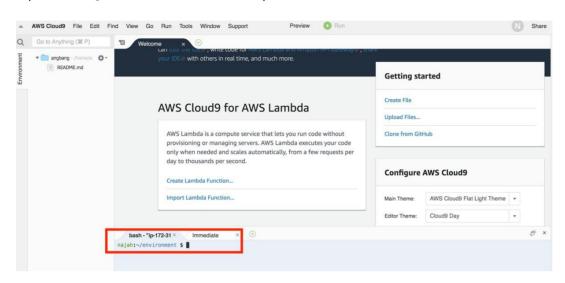

- 4. On the Name environment page, for Name, type a name for your environment. For this tutorial, use my-demo-environment.
- 5. For **Description**, type something about your environment. For this tutorial, use This environment is for the AWS Cloud9 tutorial.
- 6. Choose **Next step**.
- 7. On the Configure settings page, for Environment type, choose Create a new instance for environment (EC2).
- 8. For Instance type, leave the default choice. This choice has relatively low RAM and vCPUs, which is sufficient for this tutorial.
- 9. For Platform, choose the type of Amazon EC2 instance that AWS Cloud9 will create and then connect to this environment: Amazon Linux or Ubuntu.
- 10. For Cost-saving setting, choose the amount of time until AWS Cloud9 shuts down the Amazon EC2 instance for the environment after all web browser instances that are connected to the IDE for the environment have been closed. Or leave the default choice.
- 11. Leave the default settings for **Network settings (advanced)**.
- 12. Choose **Next step**.
- 13. On the **Review** page, choose **Create environment**. Wait while AWS Cloud9 creates your environment. This can take several minutes.

After AWS Cloud9 creates your environment, it displays the AWS Cloud9 IDE for the environment.

If AWS Cloudy doesn't display the IDE after at least five minutes, there might be a problem with your web browser, your AWS access permissions, the instance, or the associated virtual private cloud (VPC). For possible fixes, see Cannot Open an Environment in Troubleshooting.

Copy Data across from staging Amazon S₃ bucket to your S₃ bucket

Open Cloudy Console from AWS and you will see the terminal screen in the bottom:

a) Generate a key pair by issuing the following command

ssh-keygen

- Press enter3 times to take the default choices
- Upload the public key to your EC2 region:

```
aws ec2 import-key-pair --key-name "lfworkshop" --public-key-material
file://~/.ssh/id rsa.pub
```

d) Issue the following command in the terminal, and replace the bucket name with your existing or a new S3 bucket dedicated for the lab.

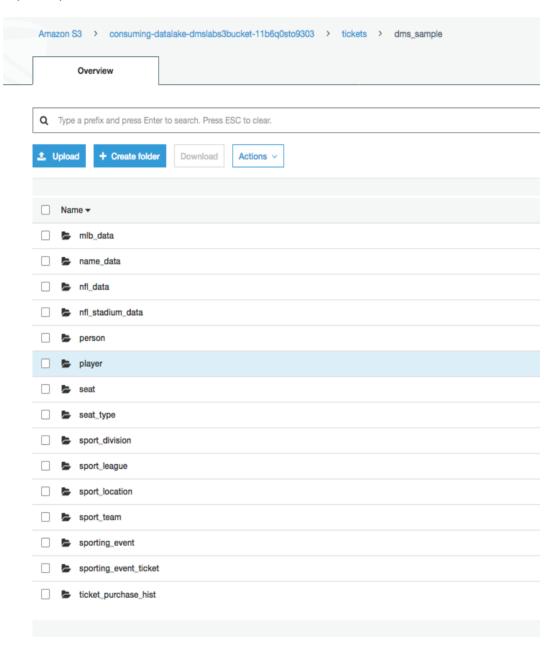

NOTE: if you are in an AWS hosted event, the destination S_3 bucket is created on your behalf. Go to S_3 console, search for a keyword dmslabs3bucket. The bucket name looks like "xxx-dmslabs3bucket-xxxx"

```
aws s3 cp --recursive s3://consuming-datalake-staging/tickets/
s3://<BucketName>/tickets/
```

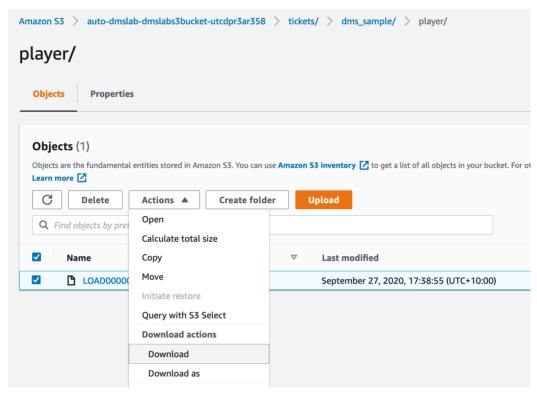

The data will be copied to your S₃ Bucket and you will see the following:

```
-103XqomqkqX1n/t1ckets/ams_sample/ntl_data/LUADWWWWWWW1.csv
\verb|copy: s3://consuming-data| a ke-staging/tickets/dms\_sample/nfl\_stadium\_data/LOAD00000001.csv to s3://lake-formation-wf-dmslab| a ke-staging/tickets/dms\_sample/nfl\_stadium-data/LOAD00000001.csv to s3://lake-formation-wf-dmslab| a ke-staging/tickets/dms\_sample/nfl\_stadium-data/LOAD00000001.csv to s3://lake-formation-wf-dmslab| a ke-staging/tickets/dms\_sample/nfl\_stadium-data/LOAD00000001.csv to s3://lake-formation-wf-dmslab| a ke-staging/tickets/dms\_sample/nfl\_stadium-data/LOAD00000001.csv to s3://lake-formation-wf-dmslab| a ke-staging/tickets/dms\_sample/nfl\_stadium-data/LOAD000000001.csv to s3://lake-formation-wf-dmslab| a ke-staging/tickets/dms\_sample/nfl\_stadium-data/LOAD000000001.csv to s3://lake-formation-wf-dmslab| a ke-staging/tickets/dmslab| a ke-staging/tickets
s3bucket-1d3xq6mdkqx1n/tickets/dms_sample/nfl_stadium_data/LOAD00000001.csv
mslabs3bucket-1d3xq6mdkqx1n/tickets/dms_sample/sporting_event_ticket/LOAD000000002.csv
copy: \ s3://consuming-datalake-staging/tickets/dms\_sample/person/LOAD00000001.csv \ to \ s3://lake-formation-wf-dmslabs3bucket-1 \ to \ s3://lake-formation-wf-dmsl
d3xq6mdkqx1n/tickets/dms_sample/person/LOAD00000001.csv
copy: s3://consuming-datalake-staging/tickets/dms_sample/ticket_purchase_hist/LOAD00000001.csv to s3://lake-formation-wf-dm
slabs3bucket-1d3xq6mdkqx1n/tickets/dms_sample/ticket_purchase_hist/LOAD00000001.csv
copy: s3://consuming-datalake-staging/tickets/dms_sample/sporting_event_ticket/LOAD00000001.csv to s3://lake-formation-wf-d
mslabs3bucket-1d3xq6mdkqx1n/tickets/dms_sample/sporting_event_ticket/LOAD000000001.csv
```

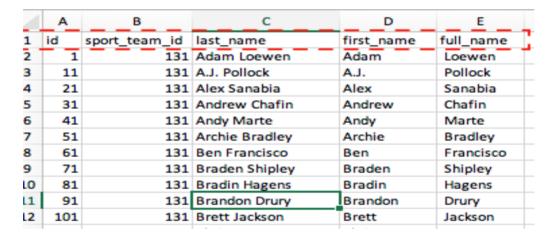

- Open the S₃ console and view the data that was copied from Cloud9 terminal.
- 2. Your data files in a S3 bucket will look like this: BucketName/bucket_folder_name/schema_name/table_name/csv files/
- 3. In our lab example, this becomes: "/<BucketName>/tickets/dms_sample" with a separate path for each table_name

- Download one of the files:
 - a. Select a table/folder name, tick the check box next to a CSV file name, and choose **Download** option from the **Actions** dropdown list.
 - b. Click Save File.
 - c. Open the file.

Note that column names are included in the file in the first row.

Explore the objects in the S₃ directory further.

Next Steps

In the next part of this lab, we will complete the following tasks:

• Extract, Transform and Load Data Lake with AWS Glue

Appendix A: Self-Paced Data Lake Lab

If you If want to re-run the lab by yourself, please follow the lab instruction published in the GitHub:
